GitHub Copilot Setup & FAQ

Welcome to your hands-on experience with GitHub Copilot (GHCP)!

Getting Started

Prerequisites

1. **GitHub Account**: You'll need a GitHub.com account with a primary or secondary ACN email address
2. **Visual Studio Code**: Make sure to have VS Code installed (community version is sufficient)
3. **GHCP Setup**: Follow the steps below to get started
4. **Development Environment**: Basic familiarity with command line tools

GHCP Setup

1. Open VS Code
2. Open the preinstalled Copilot Extension by clicking on the Copilot icon on the top (right next to the search bar)
3. Either use the free version, which has a limited model selection and request limits or proceed with step 4.
4. Log in to your GitHub Account by using the bottom right copilot icon -> set up copilot.
5. Acquire a GHCP License either through:
    - Use the 30-day free trial @ Signup to GitHub Copilot Pro
    - Alternative: Ask your project
    - Alternative: Check with your Circle Lead if you're allowed to charge the $30 to the Circle WBS

FAQ

Getting Started with GitHub Copilot

Q: For which Task can I use GitHub Copilot? A: You can use GHCP for the fundamental, and advanced Tasks.

Access and Permissions

Q: What GitHub requirements do I need to meet? A: You must have a GitHub.com account with either a primary or secondary ACN email address associated with it. This is mandatory for repository access and evaluation.

Q: How do I get access to this upskilling opportunity? A: To participate in this Agentic AI experience, please request approval from your circle lead.

Q: Who handles approvals and administrative matters? A: Your circle lead handles all approval requests, including credit purchases and access permissions.

Repository Requirements

Q: What are the repository requirements? A: Your code must be uploaded to a **private** GitHub repository. Public repositories are not acceptable for this project. Once your project is complete, share repository access with the evaluation team.

Q: What should I include in my repository? A: Your repository should contain:

- Complete backend code with API implementation
- Frontend application code
- Docker Compose configuration file
- README.md with setup and running instructions
- Any additional documentation or notes

Technical Specifications

Q: Are unit tests mandatory? A: Unit tests for both backend and frontend are optional but recommended. They demonstrate good development practices and can be a valuable learning experience with GHCP.

Q: What should my Docker Compose setup include? A: Your docker-compose.yml should orchestrate both your backend and frontend services, allowing the entire application to run with a single `docker-compose up` command.
